PRINTER INVENTORY FORECASTING & REGIONAL ALLOCATION

Four role-based dashboards | Monthly model-wise planning for North, East, West and South

PROBLEM WE ARE SOLVING

Forecasts may not match regional sales needs, while limited inventory must be shared across four regions. Separate manual updates make it difficult to track revisions, approvals and stock transfers in one place.

PROPOSED SOLUTION

Four role-based dashboards share one workflow: the Forecaster enters and publishes forecasts; Regional Managers review sales, revise forecasts and finalize allocations; Planning sees every revision alongside inventory and approves model-wise allocations; and Admin monitors all regions, forecasts, inventory, approvals, changes and audit history in one place.

END-TO-END WORKFLOW

FORECAST SUBMITTED > REGIONAL REVIEW > PLANNING > ALLOCATION > FINALIZATION

PROCESS STEPS

1. Forecaster dashboard Enter next-month demand for each printer model and region, then approve/publish the forecast for regional review.

2. Regional Manager dashboard Review historical sales, increase or decrease forecast quantities where justified, and submit the revised forecast.

3. Planner dashboard The updated regional forecast appears with available inventory for each printer model, so Planning can compare demand with stock.

4. Planning allocation If stock is constrained, begin with 25% per region as a baseline; if stock is sufficient, allocate to regional need. Planning reviews and approves the allocation.

5. Regional finalization Managers view the proposed allocation and can add units to one region by reducing another, then finalize. Total allocation cannot exceed available stock.

6. Admin dashboard Monitor all four regions and printer models in one place: forecasts, revisions, inventory, allocations, approvals and change/audit history.

EXAMPLE: PRINTER MODEL A

Available inventory = 100 units

Allocation	North	East	West	South	Total
Initial	25	25	25	25	100
Rebalanced	30	20	25	25	100

Example change: move 5 units from East to North. Regional totals change, but the overall stock remains 100.

Key control: The 25% split is a starting baseline only when inventory is constrained. Final quantities must follow approved regional demand, inventory limits and traceable manager changes.
